Neurological problems pdf

Continue

Updated: 10/11/2021 by Computer Hope Sometimes referred to as an issue, a problem is any situation that occurs that is unexpected or prevents something from occurring. When dealing with computer problems, you must first understand the source of the problem and then find a solution to fix the problem. Locating the source of a problem is known as troubleshooting. When dealing with software problems where bugs exist in a program, you need to download a patch that resolves the issue. Other software problems may be solved by changing a setting in the program or computer, or closing other programs that are conflicting with the program. When hardware problems or physical defects occur, the only solution may be to replace the malfunctioning device. Tip See our error page for a listing of errors. Bug, Paradigm, Problem Reports and Solutions, Troubleshoot By Eleanor Bird, M.S. on July 16, 2020 — Fact checked by Jessica Beake, Ph.D.A new report of COVID-19 patients referred to a neurological hospital in the United Kingdom describes complications including delirium, brain inflammation, and stroke.Share on PinterestNew research looks into the neurological effects of COVID-19 on some patients.Viral infections can impact the brain, even if the virus has not directly infected brain tissue. For example, inflammation of the brain, or encephalitis, most often results from a viral infection. These infections usually cause mild, flu-like symptoms, but when they affect the brain, the issues can be severe.At around the same time as the 1918 flu pandemic, there was an epidemic of encephalitis lethargica, or “sleeping sickness.” Between 1917 and 1927, millions of people likely developed this issue worldwide. Many of the survivors experienced lasting behavioral changes and extreme lethargy. Some lived in catatonic states.Previously, some researchers have observed a link between infections with SARS-CoV and MERS-CoV — the coronaviruses that cause SARS and MERS, respectively — and signs of damage within the central nervous system.The new coronavirus has also been associated with neurological symptoms. However, our understanding of the neurological consequences of COVID-19 remains in its early stages.A recent report, led by experts from the Institute of Neurology at University College London, describes cases of delirium, brain inflammation, stroke, and nerve damage associated with COVID-19.The authors say that their report, which is published in the journal Brain, provides a template to help researchers around the world improve the diagnosis and treatment of the neurological complications of COVID-19.The study describes the experiences of 43 people with suspected or confirmed COVID-19 who were referred to the National Hospital for Neurology and Neurosurgery, in the U.K. The group had a wide age range of 16–85 years.The study team analyzed both the clinical features and the results of brain scans and laboratory tests, and it is the first to have done so in this context.The report details 10 cases of temporary brain dysfunction, or encephalopathies, with delirium. These patients were mostly over 50 and presented with confusion and disorientation, with one patient experiencing psychosis. A further 12 patients experienced inflammation of the brain. The majority of these people experienced a rare disorder called acute demyelinating encephalomyelitis (ADEM), which is triggered by viral infections and leads to damage of the myelin sheaths around nerves.The researchers note that ADEM is more common in children and that they typically see around one adult with the condition per month. During the period that the study was concerned with, this rate increased to one case per week. This is concerning, as ADEM can progress to multiple sclerosis.The team also found reports of nerve damage. Specifically, there were seven reports of Guillain-Barré syndrome, a rare neurological disorder in which a person’s immune system attacks healthy nerve networks.This syndrome is often associated with a prior infection and also involves damage to myelin.The finding is consistent with a previous report, from Italy, of five cases of Guillain-Barré syndrome in COVID-19 patients.“We identified a higher-than-expected number of people with neurological conditions such as brain inflammation, which did not always correlate with the severity of respiratory symptoms. We should be vigilant and look out for these complications in people who have had COVID-19.”– Co-senior author Dr. Michael ZandiThe team also reported eight cases of stroke, which confirms previous findings. These cases are thought to result from the “sticky blood” found in COVID-19 patients. The remaining patients had other neurological complaints, including dysfunction of the cranial nerve and a brain abscess.Interestingly, some patients in the study did not experience any severe respiratory symptoms, making their neurological symptoms the first and major presentation of COVID-19.The authors say that doctors should look out for possible neurological symptoms in people with suspected COVID-19.“Doctors need to be aware of possible neurological effects, as early diagnosis can improve patient outcomes. People recovering from the virus should seek professional health advice if they experience neurological symptoms,” says co-lead author Ross Paterson, Ph.D.In eight of the patients, the fluid that surrounds the brain and spinal cord was tested for the virus, and no evidence of it was found. This suggests that neurological symptoms of COVID-19 are not a result of a direct attack on the nervous system.Understanding exactly how an infection with the new coronavirus causes these symptoms will require more research. However, it seems likely that the neurological consequences of COVID-19 result from an immune response gone awry, rather than the virus itself.For live updates on the latest developments regarding the novel coronavirus and COVID-19, click here.Infectious Diseases / Bacteria / VirusesNeurology / NeuroscienceCOVID-19 Everyone laughs when I tell them that I wrote Codependency for Dummies. But codependency is no laughing matter. It causes serious pain and affects the majority of Americans — and not just women or loved ones of addicts, as many people believe.So what is it? My definition is someone who has lost the connection to his or her core self, so that his or her thinking and behavior revolves around someone or something external, including a person, a substance, or an activity, such as sex or gambling.It’s as if codependents are turned inside out. Instead of self-esteem, they have other esteem, based upon what others think and feel. Instead of meeting their own needs, they meet the needs of others, and instead of responding to their own thoughts and feelings, they react to those of others. It’s a haywire system, because they have to control others to feel okay, but that just makes matters worse and leads to conflict and pain. It also makes emotional intimacy difficult.Some people criticize the codependency movement and say that it’s created more loneliness. They argue that relationships are nurturing and that we’re naturally meant to be dependent. I couldn’t agree more. The point is that codependent relationships are not only painful, but can be unsupportive and destructive. Codependents have problems receiving the good stuff that relationships can potentially offer.Codependency for Dummies goes into great detail about the difference between codependent and healthy, interdependent relationships, between healthy caregiving and codependent care-taking, and understanding the boundaries between responsibility for yourself and responsibility to others, something that eludes codependents.Not all codependents are caretakers, but if you are one, you have a hard time listening to other people’s problems without trying to help. Sometimes you even feel responsible and guilty for their feelings. This creates high reactivity for couples who constantly are blaming each other for their own feelings and defending themselves when their partner shares his or her feelings.What’s missing is a sense of separateness between them known as emotional boundaries. Boundaries simply mean that your thoughts and feelings belong to you. I’m not responsible for them; I didn’t make you feel them. For real intimacy to happen, you need to have a sense of separate identity and feel safe enough to express your feelings without being afraid of criticism or rejection.This is where the codependent core issue of low self-esteem comes in. With a fragile self, codependents are afraid of rejection and abandonment, but on the flip side, they fear losing themselves when they get attached in a relationship. They tend to give up their needs to accommodate their partner, sometimes letting go of outside friends and activities they used to enjoy, and even when the relationship isn’t working, they are stuck like glue. So many codependents aren’t even in relationships, contrary to common belief, because they’re afraid of losing their independence, which you don’t really lose in a healthy interdependent relationship.Many codependents have to dance a tightrope of pursuing partners, but never really catching them, or distancing themselves, but never really leaving. It’s a two-step that’s even done in marriages, but creates constant pain in the relationship. Fleeting moments of closeness are just enough to keep the dance going, unless the partners give up on intimacy entirely.Communication is another area where dependents have a dilemma. They can’t say “No” without feeling guilty, and are resentful when they say “Yes” to things they would rather not do. This is because they avoid taking positions at all costs, due to their fear of rejection. Like clever politicians, they don’t want to say anything that might upset someone else.The book goes into detail about how to improve your communication. You’ll learn how to be assertive, how to set boundaries, and how to handle verbal abuse. You can practice saying no on your own. Codependents are always explaining and justifying themselves. Remember, “No” is a complete sentence.Codependents spend far too much of their precious lives worrying about things and people over which they have no control. Healing from codependency starts with getting to know yourself better, honoring yourself, and expressing yourself. Start doing things that make you happy, rather than deferring to others or waiting for someone else to make you happy. Building a relationship with yourself leaves you no time to worry about someone over whom you have no control, anyway. You might think this is selfish, but when you love yourself, you radiate love that’s healing to be around. It overflows onto everyone you interact with.
